

Every project deserves a Claude built in

Not just for engineers — for any initiative in the company

Why Claude belongs in every project

- 1 Keeps the plan on track**
So nothing falls through the cracks
- 2 Does the actual work**
Writes the docs, files, and updates
- 3 Remembers what happened**
Keeps history when it matters
- 4 Anyone can jump in, anytime**
No special access needed
- 5 Humans stay in the loop**
Steering, double-checking, catching mistakes

“If Claude isn't part of the project, the project is working harder than it needs to.”

Chat, Code, and Skills were never meant to work alone

WHAT PEOPLE PICTURE

Claude chat

“Just a conversation”

Claude code

“Just writes code”

Skills

“Just a one-off task”

WHAT'S ACTUALLY POSSIBLE

Claude chat + Claude code

Talk to each other directly

Both reach Linear, Git, and a database

Through MCPs and CLIs you already have

One connected system

Not three separate tools

Already accessible — no special setup required.

One ordinary project, walked end to end

Planning the Q3 team offsite — not a line of code in sight

OFFSITES — ONE TEAM, ONE REPO, ONE DATABASE, EVERY QUARTER

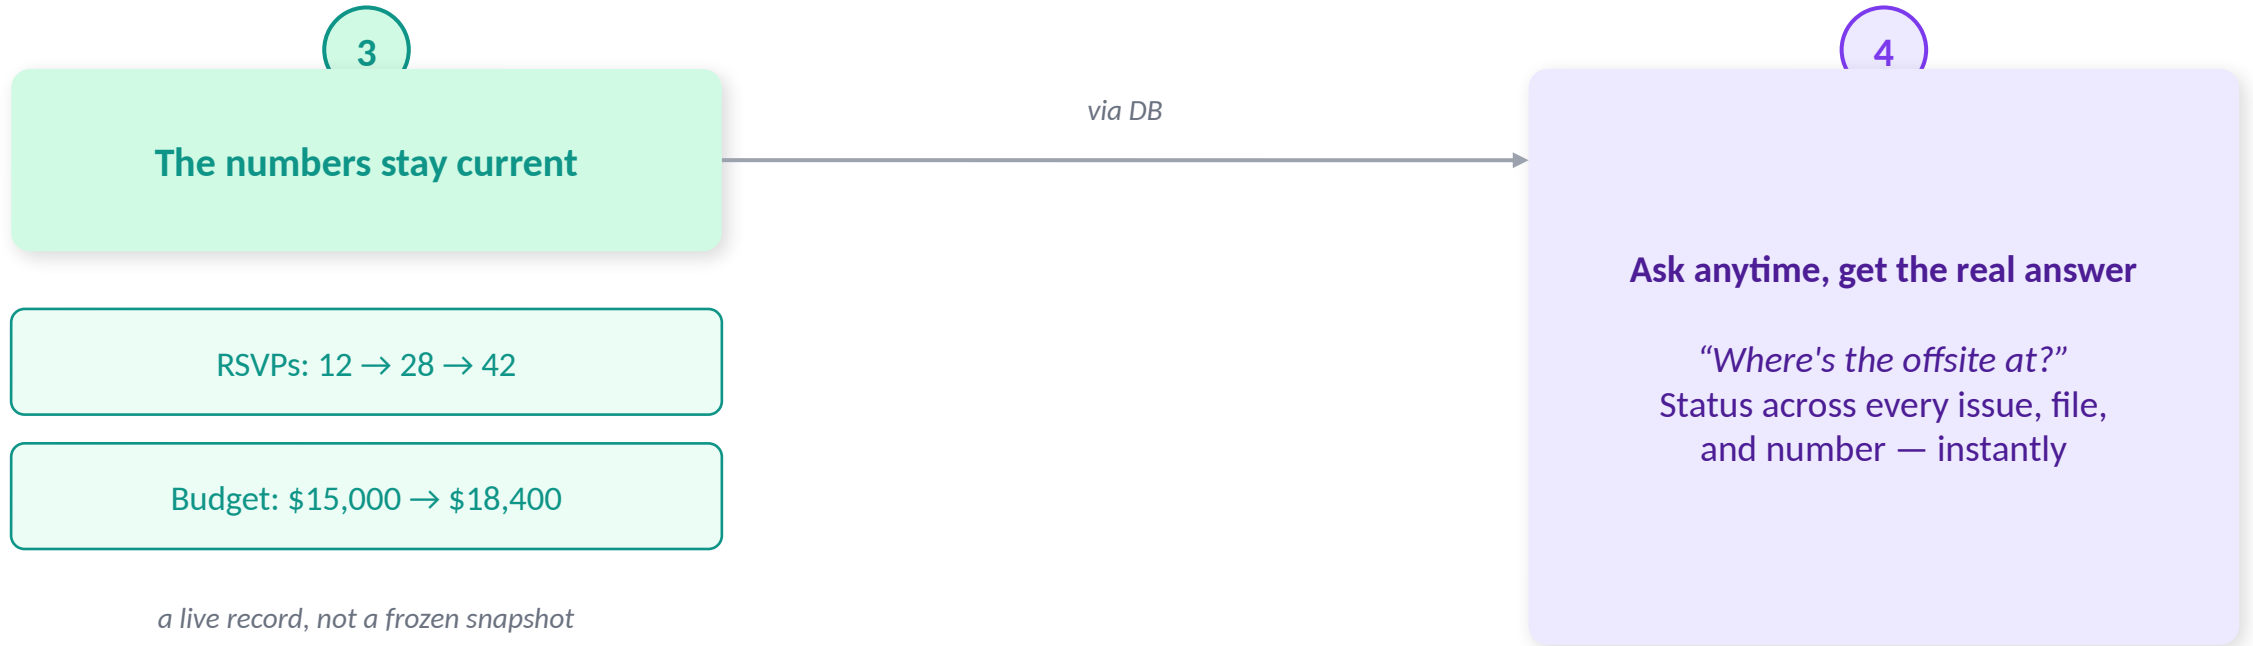

one goal becomes several tracked issues

every step leaves a real, versioned file

continued →

One ordinary project, walked end to end (continued)

Still the same Offsites Team, repo, and database

***If it has a goal, a deadline, and more than one moving part — it's already a project.
The only question is whether Claude knows about it yet.***

All of this runs through MCPs and CLIs you already have — no special setup.

When does this actually beat Notion?

Notion	Linear + Git + Database
Page history — a linear undo log	Real git history — diffable, branchable, revertible
Filtered views — a few hundred rows	Real SQL queries — joins, aggregates, real scale
Block-based API — good for reading docs	Structured APIs — built for precise agent read/write
Notion + GitHub + Airtable — still needs someone to stitch them together	Claude operates all three automatically — the integration is the actual product

*If the project is simple and short-lived, Notion is still the right call.
This is for work that recurs and accumulates decisions over time.*

The only question is whether Claude knows about it yet.

Pick one recurring project. Give it a Team, a repo, and a database. See what changes.
